- During the coding process, I faced many issues with the maodos_front_page.php because I believed that it would translate over to the home.php front page with moving images and I was never able to fully resolve this issue, that is why there are no pictures.

- My Goal for the website was to be a simple design with a nice and warming font that felt comforting to people, which explains my word choice in the home tab

- Adding the words was very simple and I ran into an error where the words were not printing onto the screen but it was because I was missing the 'tags'

- Starting off with the homepage, many of the fonts that I tried to use did not apply so I settled for a simple yet nice-looking font

- The Colorway is what I imagined resembled the most fitness the color green looks very fitting and most fitting for the website

- The moving images were not working for me no matter how much I attempted, I looked up online as to why this wasn't working but still couldn't come up with an answer, so I decided to leave the pictures off, I applied the pictures to the GitHub as an example of what they would've been. The pictures are here as well.

- Translating everything else was rather easy as the spaces were perfect for my logo and it didn't require much change if any

- I applied a Home, Contact, Services, and About section which are all interactable with their own html, and php. The making of the Html and Php was simple as I followed online guides on how to make an intractable html file that would allow people to type in information and read bold words with descriptions of what to apply for my

- The services page was for the purpose of adding things that new people to the website would see so it would be helpful such as Personal Training, Nutrition Coaching, Group Fitness Classes, and Fitness Assessments. All have detailed descriptions of what they do for anyone confused.

- When I tried adding the shuffled images feature, I realized that they led to incorrect image paths. This caused broken image icons to appear and only texts, even though I tried to attempt to fix the issue by putting it in the correct directories they never worked, this is what the images would've looked like for nutrition

- Each service is explained clearly with descriptions.

- The display for the bolded words on the services page did not display for the first few attempts until I realized that the wording was spelled wrong, this delayed me about 10 minutes

- The Contact Page was the most difficult one to set due to the boxes, and it being interactable and requiring the use of a proper email this setup took a while as I had to find a proper code that would allow this to happen without getting errors that canceled the entire Contact Page, it also allows for Messages to be sent

- The Contact Page Allows users to get in touch with the fitness team

- The contact form for users allows them to submit their name, email, and message.

- The Contact form still allows for no submission but it leads to a dead page, I was unable to fix this as I didn't know how to.

- The About Us Page has the company's Mission Plan, and reasons as to why to Choose It.

- Adding the Why to choose us was very simple as done in the code before previously.

- The legal php portion was originally working as it was a clickable link however even when I attempted to make the HTML page for the legal page with some legal information it would not work, the only thing that it showed for me was the page with the code but no matter what I applied for the legal.php it wouldn't work so I ended up scrapping it due to time.

- I made many changes to the code instead of keeping Bob Auto Parts I changed them to Maodo's Fitness Program
